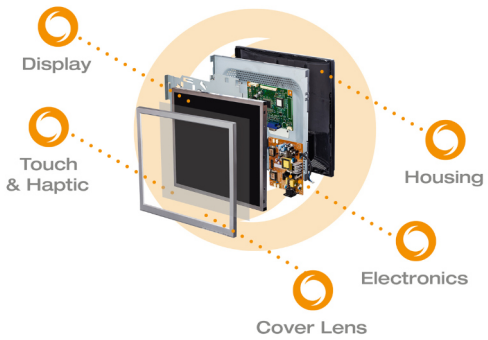
We Display Your Brilliance.

- Customized optically bonded touch display complete solutions
- Video surveillance and seat control
- Glass panel solutions with capacitive devices such as switches with force feedback, indicator lamps
- Custom touch sensor design, haptic feedback
- Custom interface and control boards



Every HMI consists of individual components such as display, touch, electronics, cover lens and housing that work together to meet individual application requirements. Only by considering all components can performance requirements such as sunlight readability, touch and haptics, EMC, black panel effect and cleanability be achieved. To ensure that all environmental and performance requirements can be met, components are selected from our global supplier network.

Without light, a display is just a sheet of glass.
Without electronics, no light.
Without software, no image.

We master the entire spectrum from mechanics to electronics, light and software to final integration.
We turn innovative light and display applications into your marine product.

You get the complete package or individual services from us - whatever you need.
